

The ways I work

Tools expand possibilities

I learn tools to expand what I can imagine and build.

Built a gaze-tracking vehicle entry prototype for Ford using TensorFlow, Python, and Arduino—learning computer vision tools to explore hands-free interaction.

Claude-coded a native iOS app in SwiftUI to test multi-agent AI coordination in a real iOS app—answering questions about how agents work together that prototypes couldn't solve.

Built a Python Streamlit app using Claude as an automated judge to evaluate HatchAI routing and responses—learning tools to assess quality at scale beyond manual testing.

The ways I work

0→1 in ambiguous spaces

I turn uncertainty into shipped products.

Built and shipped Hatch's first AI service with no precedent: prototyped conversation flows and AI-to-human handoffs to define what hybrid sleep coaching should be, then launched the full interaction model.

Turned COVID disruption into shipped product for Føtex: rapidly prototyped and tested mobile commerce to define digital-first grocery shopping, then launched at speed.
